RESEARCH OVERVIEW / VERSION 1.0.0

Beyond UIERU: Dynamic Structural Intelligence and Open Research Relay

Sizhe Tan & GPT-Obot | Open research framework | October 2026

KEY IDEA

Move from relatively static structural intelligence components to observable, comparable, composable, and evolvable dynamic intelligence units—and make the associated research questions portable through an open, evidence-aware Research Relay.

RESEARCH ARCHITECTURE

OBSERVE	Perspective-aware UIERU states, context, history, and evidence
COMPARE	Masking, differential trees, structural queries, and conditional equivalence
COMPOSE	Relay interfaces, contracts, substitution, and system-level guarantees
EVOLVE	Governed structural growth, RSI interoperability, and counter-evidence
RELAY RESEARCH	Transfer problems, hypotheses, validation tasks, and revisions

WHAT THE REPOSITORY CONTAINS

8 core papers on dynamic UIERU research; 3 cases on model selection, relay substitution, and biological intelligence; 5 Research Relay topics plus a collaboration guide; 4 specifications for observation, masking, differential queries, and research exchange; and open questions, testable hypotheses, and a validation roadmap.

OPEN QUESTIONS & SCIENTIFIC BOUNDARIES

Research directions include masking algebra, perspective differential trees, dynamic behavioral equivalence, contract-preserving relay composition, open structural evolution, biological analogies, and RSI–UIERU convergence. Proposed formal properties, biological analogies, and experimental hypotheses are not presented as proven or empirically established. Counter-evidence and independent replication are central to the program.
